CSCI 3104 Spring 2022
Instructor: Profs. Chen and Layer

Quiz 3 - Exchange Arguments

Due Date ..... February 4
Name ..... **Chengming Li**
Student ID **109251991**

Contents

1 Instructions

- The solutions **should be typed**, using proper mathematical notation. We cannot accept hand-written solutions. Here's a short intro to LaTeX.
- You should submit your work through the **class Canvas page** only. Please submit one PDF file, compiled using this LaTeX template.
- You may not need a full page for your solutions; pagebreaks are there to help Gradescope automatically find where each problem is. Even if you do not attempt every problem, please submit this document with no fewer pages than the blank template (or Gradescope has issues with it).
- You **may not collaborate with other students**. **Copying from any source is an Honor Code violation. Furthermore, all submissions must be in your own words and reflect your understanding of the material.** If there is any confusion about this policy, it is your responsibility to clarify before the due date.
- Posting to **any** service including, but not limited to Chegg, Discord, Reddit, StackExchange, etc., for help on an assignment is a violation of the Honor Code.
- You **must** virtually sign the Honor Code (see Section 2). Failure to do so will result in your assignment not being graded.

2 Honor Code (Make Sure to Virtually Sign)

Problem 1.

- My submission is in my own words and reflects my understanding of the material.
- I have not collaborated with any other person.
- I have not posted to external services including, but not limited to Chegg, Discord, Reddit, StackExchange, etc.
- I have neither copied nor provided others solutions they can copy.

Agreed (signature here). I agree to the above, Chengming Li □

3 Standard 3- Exchange Arguments

3.1 Problem 2

Problem 2. Suppose that there are n homework assignments, where the ith homework assignment has difficulty $d_i > 0$. All of the assignments are released on the first day of class, and you may turn in one assignment per week. If you turn in assignment i on week k, then you receive $(n-k)e^{d_i}$ points. Do the following.

(a) Consider a solution in which you turn in assignment j before assignment i, even though $d_i > d_j$. Show that you can increase the number of points earned by turning in assignment i before assignment j.

Proof.
- From the formula of $(n-k)e^{d_i}$, we can tell that n and d_i is a constant number, which will not affect by turning in time. Thus, the solution to increase the number of points earned by turning in assignment i before assignment j is that turn in assignment i very before the assignment j so that minimize the number of k in the formula.
- In the other words, the greedy solution is turn in the most difficult assignment at the first week, and turn in the easiest assignment at the last week of semester to maximize the number of points earned.

□

(b) Using part (a), describe a greedy algorithm to order the assignments in order to maximize the number of points earned. Pseudo-code is not required, but you should provide enough detail that a CSCI 2270 student could reasonably be expected to implement the solution from your description.

Answer.
- The greedy algorithm can resort order of assignment in descending order, like from most difficult assignment to easiest assignment, and put them into a queue.
- Because the most difficult assignment has the highest weight in the formula of earning points, and the greedy algorithm could minimize the number of week k to maximize the the number of points earned.
- k is the number of iteration in the for loop. n is the total number of homework assignments. d_i is the difficulty of assignment i. Initialize a variable named $totalscore$ to 0.
- At each iteration k, the first element will be polled from the queue, and calculate the point of this assignment eared. Then, add the point to the variable $totalscore$.
- The algorithm terminates when the iteration over. And the result can be found on the variable $totalscore$.
